MPLS Connectivity

CHALLENGE • CREATE • CONNECT

Reliable and efficient data delivery is a top priority for organizations relying on mission-critical information. The most common approach to support guaranteed Quality of Service (QoS) is Multiprotocol Label Switching (MPLS) technology, which provides control, simplicity and manageability of data transfer.

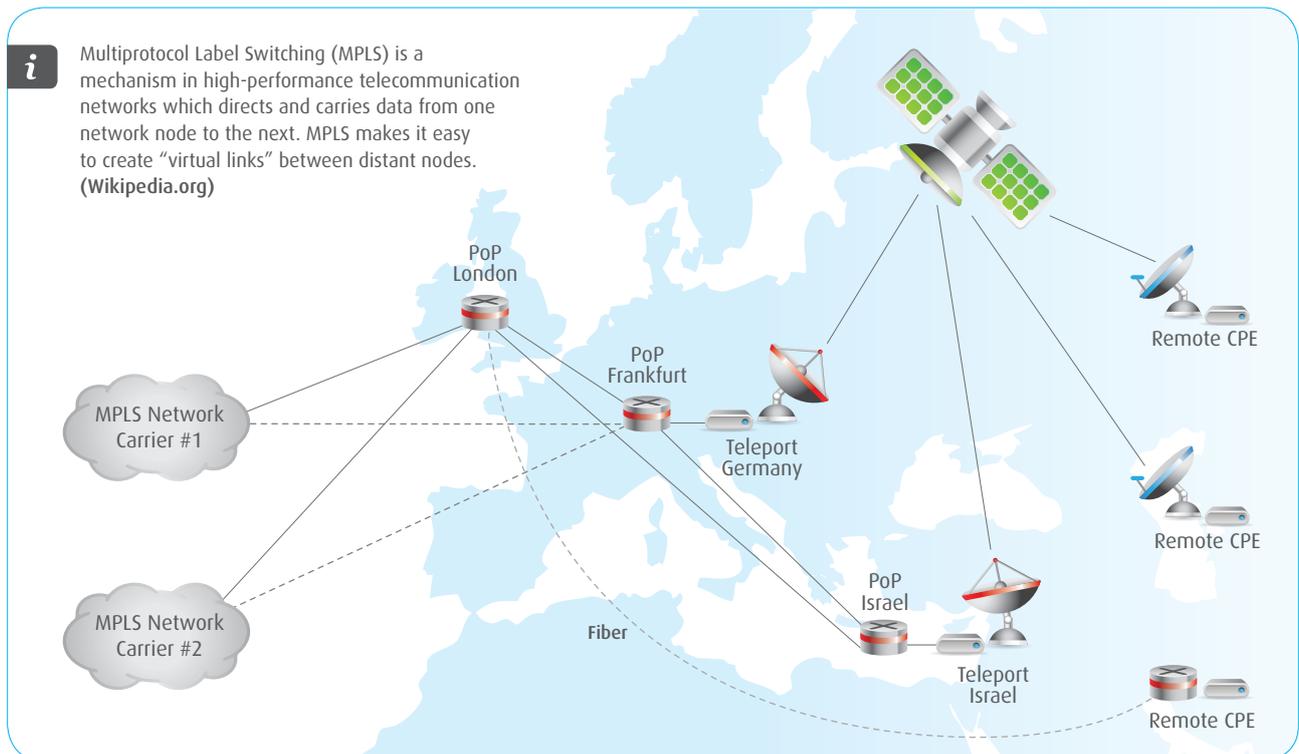

Gilat Satcom offers satellite-based MPLS broadband connectivity that can extend a global MPLS network to any location in Africa, Asia and the Middle East. This service is designed for international service providers and global organizations that need to connect remote branches using high-performance links to their core network.

Gilat Satcom MPLS solutions support multiple-service classes to ensure the delivery of time-sensitive applications such as voice and video. In addition, MPLS based routing is executed faster, reducing the round trip delays. Our satellite-based MPLS solutions enable remote locations to connect directly into the secured network without the need for a terrestrial infrastructure. Our network provides multiple MPLS points-of-presence (POPs), which enable flexible and redundant entry points to the service, thus reducing the total cost of your solution.

Gilat Satcom MPLS solutions can be used to link remote branches as part of an existing network. The solution can be used as a primary connection or back-up to an existing terrestrial MPLS connection. The service level agreements (SLA), which we provide as part of our MPLS services, ensure high-network availability, as well as the required QoS.

BENEFITS

- MPLS across the entire network
- High-availability and QoS to all locations
- SLA ensuring high performance
- Multiple POPs and redundancy
- Tiered service-classes supporting multiple levels
- Global satellite platform lay-out
- 24x7 NOC services and support
- Fully managed services
